**Amendments to the Claims**

Please rewrite claim 1.

1. (Currently Amended) A system for displaying images with the aid of a spatial light modulator wherein ~~the system~~ comprises:
  - a light source emitting an illumination beam;
  - a the spatial light modulator comprising a matrix of pixels controlled by video control signals corresponding to a succession of image frames to be displayed;
  - a matrix filter formed of a mosaic of adjacent elementary filters of various colors, illuminated by said illumination beam and transmitting a spatially filtered color beam to the spatial light modulator,
  - means for producing an image of said filter on an entrance face of the spatial light modulator;
  - means of displacement for displacing said image of the filter on the entrance face of the spatial light modulator and
  - a device for controlling these means of displacement, making it possible to control at least one sequence of displacements of the image of the filter during each image frame.
2. (Previously Presented) The system for displaying images as claimed in claim 1, wherein the dimensions and the position of each elementary filter are adapted so that the image of each of them on the entrance face of the spatial modulator covers a plurality of pixels.
3. (Previously Presented) The system for displaying images as claimed in claim 2, wherein each displacement of a sequence corresponds to a multiple of the dimension of the image of an elementary filter on the entrance face of the spatial modulator.

Serial No.: 10/532,179

PF020144

4. (Previously Presented) The system for displaying images as claimed in claim 3, wherein said mosaic is monodimensional and includes only one column of elementary filters of various colors.
5. (Previously Presented) The system for displaying images as claimed in claim 3, wherein said mosaic is bidimensional and in that said elementary filters are arranged in several rows and several columns.
6. (Previously Presented) The system for displaying images as claimed in claim 5, wherein said mosaic is formed by the repetition of blocks of elementary filters, and in that these blocks exhibit identical contours and are each composed of at least two elementary filters of different colors.
7. (Previously Presented) The system for displaying images as claimed in claim 6, wherein said mosaic is an assemblage of identical patterns each comprising the same number of blocks and the same number of elementary filters of each color in each of the rows and in each of the columns of said pattern.
8. (Previously Presented) The system for displaying images as claimed in claim 6, wherein each sequence of displacements of the image of the filter on the entrance face of the spatial light modulator allows the successive illumination of each pixel of the spatial light modulator by all the elementary filters of one and the same block.
9. (Previously Presented) The system for displaying images as claimed in claim 8, wherein, during each image frame, each pixel of the spatial light modulator is illuminated successively by all the elementary filters of a first block under the effect of a first sequence of displacements, then by all the elementary filters of at least one second block under the effect of at least one second

sequence of displacements.

10. (Previously Presented) The system for displaying images as claimed in claim 5, wherein all the sequences of displacements controlled by said control device are adapted so that the integration of the images of the filter that are obtained over the set of displacements of the sequence or sequences of each frame imparts a white colorimetry to the entrance face of the spatial light modulator.

11. (Previously Presented) The system for displaying images as claimed in claim 10, wherein said first and at least second sequences of displacements are adapted so that the integration of the images of the filter that are obtained over the set of displacements of any one of these sequences imparts a nonwhite colorimetry to the entrance face of the spatial light modulator.

12. (Previously Presented) The system for displaying images as claimed in claim 10, wherein said control device possesses the characteristics of a plurality of different sequences of displacements making it possible to impart a white colorimetry to the entrance face of the spatial light modulator and in that it selects, from among this plurality, different sequences for successive frames.
